

Exercise 2.1

Find the principal values of the following:

$$1. \sin^{-1} \left(-\frac{1}{2} \right).$$

Sol. Let $\sin^{-1} \left(-\frac{1}{2} \right) = y$, then $\sin y = -\frac{1}{2}$

Since the range of the principal value branch of \sin^{-1} is $\left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$,

therefore, $y \in \left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$ i.e., y is in fourth quadrant ($- \theta$) or in first

$$\therefore \left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$$

quadrant. Also $\sin y$ is negative, therefore, y lies in fourth quadrant and y is negative (i.e., $- \theta$).

Now $\sin^{-1} \left(-\frac{1}{2} \right) = -\sin^{-1} \frac{1}{2}$ ($\because \sin^{-1} (-x) = -\sin^{-1} x$)

$$\begin{aligned} &= -\sin^{-1} \sin \frac{\pi}{6} = -\frac{\pi}{6} \\ \therefore \text{Principal value of } \sin^{-1} \left(-\frac{1}{2} \right) \text{ is } &\left[-\frac{\pi}{2}, \frac{\pi}{2} \right] \text{ is } \left[-\frac{\pi}{6}, \frac{\pi}{6} \right]. \end{aligned}$$

$$2. \cos^{-1} \left(\frac{\sqrt{3}}{2} \right).$$

Sol. Let $\cos^{-1} \left(\frac{\sqrt{3}}{2} \right) = y$, then $\cos y = \frac{\sqrt{3}}{2}$

Since the range of the principal value branch of \cos^{-1} is $[0, \pi]$, therefore, $y \in [0, \pi]$ i.e., y is in first or second quadrant. Also $\cos y$ is positive, therefore, y lies in first quadrant.

Now $\cos^{-1} \left(\frac{\sqrt{3}}{2} \right) = \cos^{-1} \cos \frac{\pi}{6} = \frac{\pi}{6}$

$$\therefore \text{Principal value of } \cos^{-1} \left(\frac{\sqrt{3}}{2} \right) \text{ is } \frac{\pi}{6}.$$

$$3. \operatorname{cosec}^{-1} (2).$$

Sol. Let $\theta = \text{cosec}^{-1} 2$ $\therefore \theta$ is in first quadrant because $x = 2 > 0$.
 (\because If $x > 0$, then value of each inverse function lies in first quadrant.)

$$\therefore \theta = \text{cosec}^{-1} 2 = \text{cosec}^{-1} \text{cosec} \frac{\pi}{6} = \frac{\pi}{6}.$$

4. $\tan^{-1} (-\sqrt{3})$.

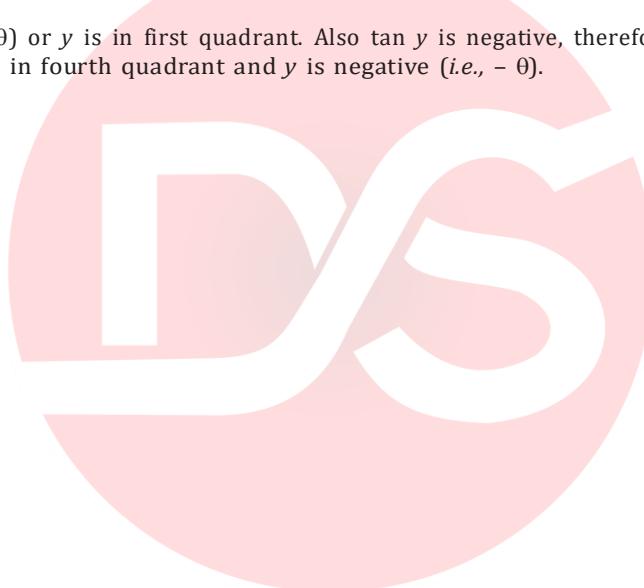

Sol. Let $\tan^{-1} (-\sqrt{3}) = y$, then $\tan y = -\sqrt{3}$

Since the range of the principal value branch of \tan^{-1} is $(-\frac{\pi}{2}, \frac{\pi}{2})$, therefore, $y \in (-\frac{\pi}{2}, \frac{\pi}{2})$ i.e., y is in fourth quadrant

$|(-\frac{\pi}{2}, 0)|$

$|(\frac{\pi}{2}, \frac{\pi}{2})|$

$(-\theta)$ or y is in first quadrant. Also $\tan y$ is negative, therefore, y lies in fourth quadrant and y is negative (i.e., $-\theta$).

$$\text{Now } \tan^{-1} \left(-\frac{1}{\sqrt{3}} \right) = -\tan^{-1} \frac{1}{\sqrt{3}} \quad (\because \tan^{-1}(-x) = -\tan^{-1}x)$$

$$= -\tan^{-1} \tan \frac{\pi}{3} = -\frac{\pi}{3}$$

\therefore Principal value of $\tan^{-1} \left(-\frac{1}{\sqrt{3}} \right)$ is $\left(-\frac{\pi}{3} \right)$.

5. $\cos^{-1} \left(-\frac{1}{2} \right)$.

$$\text{Sol. Let } \cos^{-1} \left(-\frac{1}{2} \right) = y, \text{ then } \cos y = -\frac{1}{2}$$

Since the range of the principal value branch of \cos^{-1} is $[0, \pi]$, therefore, $y \in [0, \pi]$ i.e., y is in first or second quadrant. Also $\cos y$ is negative, therefore, y lies in second quadrant (i.e., $y = \pi - \theta$).

$$\text{Now } \cos^{-1} \left(-\frac{1}{2} \right) = \pi - \cos^{-1} \frac{1}{2} \quad (\because \cos^{-1}(-x) = \pi - \cos^{-1}x)$$

$$\begin{aligned} &= \pi - \cos^{-1} \cos \frac{\pi}{3} = \pi - \frac{\pi}{3} = \frac{2\pi}{3} \\ &\therefore \text{Principal value of } \cos^{-1} \left(-\frac{1}{2} \right) \text{ is } \frac{2\pi}{3}. \end{aligned}$$

6. $\tan^{-1} (-1)$.

$$\text{Sol. Let } \theta = \tan^{-1} (-1) \therefore \theta \text{ lies between } -\frac{\pi}{2} \text{ and } 0 \quad (\because x = -1 < 0)$$

[Note. For $x < 0$, values of $\sin^{-1} x$, $\tan^{-1} x$ and $\cosec^{-1} x$ lies between $-\frac{\pi}{2}$ and 0 .]

$$\therefore \tan^{-1} (-1) = -\tan^{-1} 1 = -\tan^{-1} \tan \frac{\pi}{4} = -\frac{\pi}{4}$$

7. $\sec^{-1} \left(\frac{2}{\sqrt{3}} \right)$.

$$\text{Sol. Let } \sec^{-1} \left(\frac{2}{\sqrt{3}} \right) = y, \text{ then } \sec y = \frac{2}{\sqrt{3}}$$

Since the range of the principal value branch of \sec^{-1} is $[0, \pi] - \left\{ \frac{\pi}{2} \right\}$, therefore, $y \in [0, \pi] - \left\{ \frac{\pi}{2} \right\}$ i.e., y is in first quadrant or

second quadrant. Also $\sec y$ is positive, therefore, y lies in first quadrant.

$$\left(\frac{2}{\sqrt{3}} \right) \quad \left(-\frac{\pi}{6} \right) \quad \frac{\pi}{6}$$

$$\text{Now, } \sec^{-1} \left| \left(\frac{2}{\sqrt{3}} \right) \right| = \sec^{-1} \left| \left(\sec \frac{\pi}{6} \right) \right| = \frac{\pi}{6}$$

$$\left(\frac{2}{\sqrt{3}} \right) \quad \frac{\pi}{6}$$

\therefore Principal value of $\sec^{-1} \left| \left(\frac{2}{\sqrt{3}} \right) \right|$ is $\frac{\pi}{6}$.

$$8. \cot^{-1} (\sqrt{3}) > 0.$$

Sol. Let $\theta = \cot^{-1} (\sqrt{3})$

$\therefore \theta$ is in first quadrant because $x = \sqrt{3}$

$$\therefore \theta = \cot^{-1} \sqrt{3} = \cot^{-1} \cot \frac{\pi}{6} = \frac{\pi}{6}.$$

$$9. \cos^{-1} \left| \left(\frac{-1}{\sqrt{2}} \right) \right|$$

Sol. Let $\theta = \cos^{-1} \left| \left(\frac{1}{\sqrt{2}} \right) \right|$

$\therefore \theta$ lies between $\frac{\pi}{2}$ and π ($\because x = -\frac{1}{2} < 0$)

(**Note.** For $x < 0$, value of $\cos^{-1} x$, $\cot^{-1} x$ and $\sec^{-1} x$ lies between $\frac{\pi}{2}$ and π .)

$$\therefore \cos^{-1} \left| \left(-\frac{1}{\sqrt{2}} \right) \right| = \pi - \cos^{-1} \frac{1}{\sqrt{2}}$$

$$= \pi - \cos^{-1} \cos \frac{\pi}{4} = \pi - \frac{\pi}{4} = \frac{4\pi - \pi}{4} = \frac{3\pi}{4}.$$

$$10. \cosec^{-1} (-\sqrt{2}).$$

Sol. Let $\cosec^{-1} (-\sqrt{2}) = y$, then $\cosec y = -\sqrt{2}$

Since the range of the principal value branch of \cosec^{-1} is $\left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$

$- \{0\}$, therefore, $y \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] - \{0\}$. Also $\operatorname{cosec} y$ is negative,

$$\left| \left[-\frac{\pi}{2}, \frac{\pi}{2} \right] \right|$$

therefore, y lies in fourth quadrant ($-\theta$) and y is negative.

Now, $\operatorname{cosec}^{-1}(-\sqrt{2}) = -\operatorname{cosec}^{-1}\sqrt{2}$ ($\because \operatorname{cosec}^{-1}(-x) = -\operatorname{cosec}^{-1}x$)

$$= -\operatorname{cosec}^{-1} \operatorname{cosec} \frac{\pi}{4} = -\frac{\pi}{4}$$

\therefore Principal value of $\operatorname{cosec}^{-1}(-\sqrt{2})$ is $\left(-\frac{\pi}{4}\right)$.

$$\left| \left(-\frac{\pi}{4} \right) \right|$$

Find the value of the following:

$$11. \tan^{-1}(1) + \cos^{-1}\left(\frac{-1}{\sqrt{2}}\right) + \sin^{-1}\left(\frac{-1}{\sqrt{2}}\right).$$

$$\text{Sol. } \tan^{-1}(1) + \cos^{-1}\left(\frac{-1}{\sqrt{2}}\right) + \sin^{-1}\left(\frac{-1}{\sqrt{2}}\right)$$

$$= \tan^{-1}1 + \pi - \cos^{-1}\frac{1}{2} - \sin^{-1}\frac{1}{2}$$

$$= \tan^{-1} \tan \frac{\pi}{4} + \pi - \cos^{-1} \cos \frac{\pi}{3} - \sin^{-1} \sin \frac{\pi}{6}$$

$$= \frac{\pi}{4} + \pi - \frac{\pi}{3} - \frac{\pi}{6} = \frac{3\pi + 12\pi - 4\pi - 2\pi}{12}$$

$$= \frac{11\pi}{12}$$

$$= \frac{9\pi}{12} = \frac{3\pi}{4}$$

12. $\cos^{-1} \left(\frac{1}{2} \right) + 2 \sin^{-1} \left(\frac{1}{2} \right)$.

Sol. $\cos^{-1} \left(\frac{1}{2} \right) + 2 \sin^{-1} \left(\frac{1}{2} \right) = \cos^{-1} \cos \frac{\pi}{3} + 2 \sin^{-1} \sin \frac{\pi}{6}$

$$= \frac{\pi}{3} + 2 \left| \frac{\pi}{6} \right| = \frac{\pi}{3} + \frac{\pi}{3} = \frac{2\pi}{3}.$$

13. If $\sin^{-1} x = y$, then

- | | |
|-------------------------|--|
| (A) $0 \leq y \leq \pi$ | (B) $-\frac{\pi}{2} \leq y \leq \frac{\pi}{2}$ |
| (C) $0 < y < \pi$ | (D) $-\frac{\pi}{2} < y < \frac{\pi}{2}$ |

Sol. Option (B) is the correct answer.

(By definition of principal value for $y = \sin^{-1} x$, $-\frac{\pi}{2} \leq y \leq \frac{\pi}{2}$)

14. $\tan^{-1} \sqrt{3} - \sec^{-1} (-2)$ is equal to

- | | | | |
|-----------|----------------------|---------------------|----------------------|
| (A) π | (B) $-\frac{\pi}{3}$ | (C) $\frac{\pi}{3}$ | (D) $\frac{2\pi}{3}$ |
|-----------|----------------------|---------------------|----------------------|

Sol. $\tan^{-1} \sqrt{3} - \sec^{-1} (-2)$

$$= \tan^{-1} \sqrt{3} - (\pi - \sec^{-1} 2) \quad (\because \sec^{-1} (-x) = \pi - \sec^{-1} x)$$

$$= \tan^{-1} \tan \frac{\pi}{3} - \pi + \sec^{-1} \sec \frac{\pi}{3}$$

$$= \frac{\pi}{3} - \pi + \frac{\pi}{3} = \frac{\pi - 3\pi + \pi}{3} = -\frac{\pi}{3}$$

\therefore Option (B) is the correct answer.

Exercise 2.2

Prove the following:

$$1. \ 3 \sin^{-1} x = \sin^{-1} (3x - 4x^3), x \in \left[-\frac{1}{2}, \frac{1}{2} \right].$$

Sol. To prove: $3 \sin^{-1} x = \sin^{-1} (3x - 4x^3)$

We know that $\sin 3\theta = 3 \sin \theta - 4 \sin^3 \theta$

Put $\sin \theta = x \Rightarrow \theta = \sin^{-1} x$

$$\therefore \sin 3\theta = 3x - 4x^3 \Rightarrow 3\theta = \sin^{-1} (3x - 4x^3)$$

Putting $\theta = \sin^{-1} x$, $3 \sin^{-1} x = \sin^{-1} (3x - 4x^3)$.

$$2. \ 3 \cos^{-1} x = \cos^{-1} (4x^3 - 3x), x \in \left[-\frac{1}{2}, \frac{1}{2} \right].$$

$$\text{Sol. To prove: } 3 \cos^{-1} x = \cos^{-1} (4x^3 - 3x), x \in \left[-\frac{1}{2}, \frac{1}{2} \right]$$

Let $\cos^{-1} x = \theta$, then $x = \cos \theta$

We know that $\cos 3\theta = 4 \cos^3 \theta - 3 \cos \theta = 4x^3 - 3x$

$$\Rightarrow 3\theta = \cos^{-1} (4x^3 - 3x) \Rightarrow 3 \cos^{-1} x = \cos^{-1} (4x^3 - 3x).$$

$$3. \ \tan^{-1} \frac{2}{11} + \tan^{-1} \frac{7}{24} = \tan^{-1} \frac{1}{2}.$$

$$\text{Sol. To prove: } \tan^{-1} \frac{2}{11} + \tan^{-1} \frac{7}{24} = \tan^{-1} \frac{1}{2}$$

$$\text{L.H.S.} = \tan^{-1} \frac{2}{11} + \tan^{-1} \frac{7}{24} = \tan^{-1} \frac{\frac{2}{11} + \frac{7}{24}}{1 - \frac{2}{11} \times \frac{7}{24}}$$

$$\left[\because \tan^{-1} x + \tan^{-1} y = \tan^{-1} \frac{x+y}{1-xy} \right]$$

$$= \tan^{-1} \frac{\frac{48+77}{264}-14}{264-14} = \tan^{-1} \frac{250}{125} = \tan^{-1} \frac{1}{2} = \text{R.H.S.}$$

$$4. \ 2 \tan^{-1} \frac{1}{2} + \tan^{-1} \frac{1}{7} = \tan^{-1} \frac{31}{17}.$$

$$\text{Sol. To prove: } 2 \tan^{-1} \frac{1}{2} + \tan^{-1} \frac{1}{7} = \tan^{-1} \frac{31}{17}$$

$$\text{L.H.S.} = 2 \tan^{-1} \frac{1}{2} + \tan^{-1} \frac{1}{7}$$

$$= \tan^{-1} \frac{2 \times \frac{1}{2}}{1 - \left| \left(\frac{1}{2} \right)^2 \right|} + \tan^{-1} \frac{1}{7} \quad \left[\because 2 \tan^{-1} x = \tan^{-1} \frac{2x}{1 - x^2} \right]$$

$$= \tan^{-1} \frac{4}{3} + \tan^{-1} \frac{1}{7} = \tan^{-1} \frac{\frac{4}{3} \times \frac{1}{7}}{1 - \frac{4}{3} \times \frac{1}{7}}$$

$$\left[\because \tan^{-1} x + \tan^{-1} y = \tan^{-1} \frac{x+y}{1-xy} \right]$$

$$= \tan^{-1} \frac{28+3}{21-4} = \tan^{-1} \frac{31}{17} = \text{R.H.S.}$$

Write the following functions in the simplest form:

5. $\tan^{-1} \frac{\sqrt{1+x^2}-1}{x}, x \neq 0.$

Sol. Put $x = \tan \theta$ so that $\theta = \tan^{-1} x$

$$\therefore \tan^{-1} \left| \frac{\sqrt{1+x^2}-1}{x} \right| = \tan^{-1} \left| \frac{\sqrt{1+\tan^2 \theta}-1}{\tan \theta} \right|$$

$$\begin{aligned}
 &= \tan^{-1} \left(\frac{\sec \theta - 1}{\tan \theta} \right) = \tan^{-1} \left| \frac{\frac{1}{\cos \theta} - 1}{\frac{\sin \theta}{\cos \theta}} \right| \\
 &= \tan^{-1} \left(\frac{1 - \cos \theta}{\sin \theta} \right) = \tan^{-1} \left| \frac{2 \sin^2 \frac{\theta}{2}}{2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}} \right| \\
 &= \tan^{-1} \left(\frac{\tan \frac{\theta}{2}}{\frac{1}{2}} \right) = \frac{\theta}{2} = \frac{1}{2} \theta = \frac{1}{2} \tan^{-1} x.
 \end{aligned}$$

6. $\tan^{-1} \frac{1}{\sqrt{x^2 - 1}}$, $|x| > 1$.

Sol. To simplify $\tan^{-1} \frac{1}{\sqrt{x^2 - 1}}$, put $x = \sec \theta$ (See Note (iii) below)
 $(\Rightarrow \theta = \sec^{-1} x)$

$$= \tan^{-1} \frac{1}{\sqrt{\sec^2 \theta - 1}} = \tan^{-1} \left| \frac{1}{\sqrt{\tan^2 \theta}} \right|$$

$$\begin{aligned}
 &\quad | \because \sec^2 \theta - \tan^2 \theta = 1 \Rightarrow \sec^2 \theta - 1 = \tan^2 \theta \\
 &= \tan^{-1} \left(\frac{1}{\tan \theta} \right) = \tan^{-1} (\cot \theta)
 \end{aligned}$$

$$= \tan^{-1} \tan \left(\frac{\pi}{2} - \theta \right) = \frac{\pi}{2} - \theta = \frac{\pi}{2} - \sec^{-1} x.$$

$$\left| \frac{1}{2} \right| \quad \left| \frac{1}{2} \right|$$

Very useful Note: (i) For $\sqrt{a^2 - x^2}$, put $x = a \sin \theta$

(ii) For $\sqrt{a^2 + x^2}$, put $x = a \tan \theta$

and (iii) For $\sqrt{x^2 - a^2}$, put $x = a \sec \theta$.

8. $\tan^{-1} \left| \frac{\cos x - \sin x}{\cos x + \sin x} \right|, 0 < x < \pi.$

9. $\tan^{-1} \frac{x}{\sqrt{a^2 - x^2}}, |x| < a.$

Sol. To simplify $\tan^{-1} \frac{x}{\sqrt{a^2 - x^2}}$, put $x = a \sin \theta$;

Sol. We know that $\sin^{-1} (\sin x) = x$. Therefore, $\sin^{-1} \left(\sin \frac{2\pi}{3} \right) = \frac{2\pi}{3}$.

But $\frac{2\pi}{3} \notin \left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$ which is the principal value branch of \sin^{-1} .

Now, $\sin^{-1} \left(\sin \frac{2\pi}{3} \right) = \sin^{-1} \left(\sin \frac{3\pi - \pi}{3} \right) = \sin^{-1} \left[\sin \left(\pi - \frac{\pi}{3} \right) \right]$

MISCELLANEOUS EXERCISE

Find the value of the following:

1. $\cos^{-1} \left(\cos \frac{13\pi}{6} \right)$.

Sol. Here $(x) = \cos \frac{13\pi}{6} = \cos \frac{12\pi + \pi}{6} = \cos \left(2\pi + \frac{\pi}{6} \right)$
 $= \cos \frac{\pi}{6} = \frac{\sqrt{3}}{2} > 0.$

\therefore Value of $\cos^{-1} \left(\cos \frac{13\pi}{6} \right)$ lies in first quadrant.

$\therefore \cos^{-1} \left(\cos \frac{13\pi}{6} \right) = \cos^{-1} \frac{-3}{\sqrt{2}} = \cos^{-1} \cos \frac{\pi}{6} = \frac{\pi}{6}$.

2. $\tan^{-1} \left(\tan \frac{7\pi}{6} \right)$.

\therefore Value of $\tan^{-1} \left(\tan \frac{7\pi}{6} \right)$ lies in first quadrant.

$\therefore \tan^{-1} \left(\tan \frac{7\pi}{6} \right) = \tan^{-1} \frac{1}{\sqrt{3}} = \tan^{-1} \tan \frac{\pi}{6} = \frac{\pi}{6}$.

3. Prove that $2 \sin^{-1} \frac{3}{5} = \tan^{-1} \frac{24}{7}$.

Sol. Let $\sin^{-1} \frac{3}{5} = \theta$

$\Rightarrow \theta$ lies in first quadrant $(\because \frac{3}{5} > 0)$ and $\sin \theta = \frac{3}{5}$.

$$\therefore \cos \theta \text{ is positive and } = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - \frac{9}{25}} = \sqrt{\frac{16}{25}} = \frac{4}{5}$$

$$\therefore \tan \theta = \frac{\sin \theta}{\cos \theta} = \frac{\frac{3}{5}}{\frac{4}{5}} = \frac{3}{4}$$

$$4. \text{ Prove that } \sin^{-1} \frac{8}{17} + \sin^{-1} \frac{3}{5} = \tan^{-1} \frac{77}{36}.$$

$$\therefore \cot x = 1 = \cot \frac{\pi}{4}$$

$$\therefore x = \frac{\pi}{4}.$$

14. Solve the equation $\tan^{-1} \left(\frac{1-x}{1+x} \right) = \frac{1}{2} \tan^{-1} x, (x > 0)$.

Sol. Put $x = \tan \theta$

$$\therefore \text{The given equation becomes } \tan^{-1} \left| \frac{(1-\tan \theta)}{(1+\tan \theta)} \right| = \frac{1}{2} \tan^{-1} (\tan \theta)$$

$$\left| \frac{\tan \frac{\pi}{4} - \tan \theta}{1 + \tan \frac{\pi}{4} \tan \theta} \right| = \frac{1}{2} \theta$$

$$\Rightarrow \tan^{-1} \left| \frac{4}{1 + \tan \frac{\pi}{4} \tan \theta} \right| = \frac{1}{2} \theta$$

$$\Rightarrow \tan^{-1} \tan \left(\frac{\pi}{4} - \theta \right) = \frac{\theta}{2}$$

$$\Rightarrow \frac{\pi}{4} - \theta = \frac{\theta}{2} \Rightarrow \theta + \frac{\theta}{2} = \frac{\pi}{4}$$

$$\Rightarrow \frac{3\theta}{2} = \frac{\pi}{4} \Rightarrow 12\theta = 2\pi \Rightarrow \theta = \frac{2\pi}{12} = \frac{\pi}{6}$$

$$\therefore x = \tan \theta = \tan \frac{\pi}{6} = \frac{1}{\sqrt{3}}.$$

15. $\sin(\tan^{-1} x)$, $|x| < 1$ is equal to

- (A) $\frac{x}{\sqrt{1-x^2}}$ (B) $\frac{1}{\sqrt{1-x^2}}$ (C) $\frac{1}{\sqrt{1+x^2}}$ (D) $\frac{x}{\sqrt{1+x^2}}$.

Sol. $\sin(\tan^{-1} x) = \sin \theta$ where $\theta = \tan^{-1} x \Rightarrow x = \tan \theta$

$$= \frac{1}{\operatorname{cosec} \theta} = \frac{1}{\sqrt{1 + \cot^2 \theta}}$$

$$[\because \operatorname{cosec}^2 \theta - \cot^2 \theta = 1 \Rightarrow \operatorname{cosec}^2 \theta = 1 + \cot^2 \theta]$$

$$\text{Putting } \cot \theta = \frac{1}{\tan \theta} = \frac{1}{x},$$

$$\sin(\tan^{-1} x) = \frac{1}{\sqrt{1 + \frac{1}{x^2}}} = \frac{1}{\sqrt{\frac{x^2 + 1}{x^2}}} = \frac{x}{\sqrt{x^2 + 1}}$$

\therefore Option (D) is the correct answer.

16. $\sin^{-1}(1-x) - 2\sin^{-1}x = \frac{\pi}{2}$, then x is equal to
- | | | | |
|----------------------|----------------------|-------|---------------------|
| 1 | 1 | 1 | 1 |
| (A) 0, $\frac{1}{2}$ | (B) 1, $\frac{1}{2}$ | (C) 0 | (D) $\frac{1}{2}$. |

Sol. The given equation is $\sin^{-1}(1-x) - 2\sin^{-1}x = \frac{\pi}{2}$... (i)

$$\text{Put } \sin^{-1}x = \theta \quad \therefore x = \sin \theta \quad \dots (ii)$$

$$\therefore \text{Equation (i) becomes } \sin^{-1}(1-x) - 2\theta = \frac{\pi}{2}$$

$$\Rightarrow \sin^{-1}(1-x) = \frac{\pi}{2} + 2\theta$$

$$\Rightarrow 1-x = \sin\left(\frac{\pi}{2} + 2\theta\right) = \cos 2\theta = 1 - 2 \sin^2 \theta$$

Putting $\sin \theta = x$ from (ii), $1-x = 1-2x^2$

$$\text{or } -x = -2x^2 \text{ or } 2x^2 - x = 0 \text{ or } x(2x-1) = 0$$

\therefore Either $x = 0$ or $2x-1 = 0$ i.e., $2x = 1$

$$\text{i.e., } x = \frac{1}{2}.$$

Let us test these roots

$$\text{Putting } x = 0 \text{ in (i), } \sin^{-1}1 - 2\sin^{-1}0 = \frac{\pi}{2}$$

$$\text{or } \frac{\pi}{2} - 0 = \frac{\pi}{2} \text{ or } \frac{\pi}{2} = \frac{\pi}{2} \text{ which is true.}$$

$\therefore x = 0$ is a root.

$$\text{Putting } x = \frac{1}{2} \text{ in (i), } \sin^{-1}\frac{1}{2} - 2\sin^{-1}\frac{1}{2} = \frac{\pi}{2}$$

$$\text{or } -\sin^{-1}\frac{1}{2} = \frac{\pi}{2} \quad [\because t - 2t = -t]$$

or $-\frac{\pi}{2} = \frac{\pi}{6}$ which is impossible.

$\therefore x = \frac{1}{2}$ is rejected.

\therefore Option (C) is the correct answer.

17. $\tan^{-1} \left(\frac{x}{y} \right) - \tan^{-1} \left(\frac{x-y}{x+y} \right)$ is equal to

$\frac{\pi}{4}$

$\frac{\pi}{4}$

$\frac{3\pi}{4}$

- (A) $\frac{\pi}{2}$ (B) $\frac{\pi}{3}$ (C) $\frac{\pi}{4}$ (D) $-\frac{\pi}{4}$.

Sol. $\tan^{-1} \frac{x}{y} - \tan^{-1} \left(\frac{x-y}{x+y} \right)$

$$= \tan^{-1} \left| \frac{\frac{x}{y} - \left(\frac{x-y}{x+y} \right)}{1 + \frac{x}{y} \left(\frac{x-y}{x+y} \right)} \right| \quad \left(\because \tan^{-1} A - \tan^{-1} B = \tan^{-1} \frac{A-B}{1+AB} \right)$$

$$= \tan^{-1} \left| \frac{y(x+y) - x(x-y)}{y(x+y) + x(x-y)} \right|$$

Multiplying both numerator and denominator by $y(x+y)$

$$= \tan^{-1} \left[\frac{x(x+y) - y(x-y)}{y(x+y) + x(x-y)} \right] = \tan^{-1} \left(\frac{x^2 + xy - xy + y^2}{xy + y^2 + x^2 - xy} \right)$$

$$= \tan^{-1} \left(\frac{x^2 + y^2}{x^2 + y^2} \right) = \tan^{-1} 1 = \tan^{-1} \tan \frac{\pi}{4} = \frac{\pi}{4}$$

\therefore Option (C) is the correct answer.
